Abstract: The target of this case report is to see the way of effective treatment for a transphincteric fistula in a 56 years old male patient who has not had any earlier surgeries despite this problem already exists for one year. What was remarkable about that was that the fistulogram with MRI demonstrated the interesting structure of the fistula: both openings – the send and the outflow – were at the 12 o’clock brightest place, hence a more precise treatment having to be employed. Utilizing methylene blue infiltration and metal probing for prompt and exact diagnosis, the next step was the formulation of a detailed treatment approach that would best suit the needs of our patient. As a part of treatment regimen , it was decided to use an Ayurvedic approach called kshara sutra therapy. the treatment had a planned part where we removed sections of the distal tract, and finally packing left intermittent openings. After a two-month-long remarkably successful treatment. Such impressive results reflect the effectiveness of the multifaceted approach. , this case marks a major step forward through introducing the specification of the new strategies that capable of controlling difficult fistulas. These observations in this study suggest tailored treatment and may lead subsequent planning of therapeutic interventions that should be similar for near future clinical conditionings. Futhermore, they are the main advocates of considering patients' needs and applying a holistic vision in medicine.

Keywords: Transphincteric fistula, surgical treatment, Kshara sutra, MRI fistulogram, methylene blue, patient-centered care, holistic approach

Introduction

Although CTFs are rare, about 0.5% of colorectal surgeries, they are difficult to treat and can have significant complications. To treat these fists mainly is not easy because of their deep-running and seriously painful nature as patient's quality of life very much affected. The most significant aspect is that Parks and Pattison (1976) found these diseases spans over prolonged periods with notable occurrences of discomfort, incontinence, and significant decline in the quality of life, thereby becoming a tricky challenge for the conventional surgical methods that were used in the previous decades. The novel treatment methods are emphasized by the fact that the following standard procedure, although aimed at solving the problem, have often resulted in recurrences of wound and therefore functional damages, such as fecal incontinence (Vaizey et al., 2018). The case study to be discussed is the role of innovative minimally invasive surgeries which have revolutionized medical care and chronic condition management, viewed from the patient’s angle. This research proved to be an exceedingly effective in demonstrating that a good healing process coupled with a quick recovery are the keys to successfully treating patients. This is done using techniques that are less invasive and thus show of high precision without affecting nor disrupting structures. The paper comprises not only the thorough examination of an existing case of fistula treatment but also is a part of the bigger picture: the study of rivierula treatment. It provides an idea that the framework is about the find a cure maybe in the medical care but also make patients healthy (Lacy et al., 2019). In this way, there have been some overly-invasive techniques administered during the course of caring for veterans with CTF. These surgeries has caused the underlining the closure of wounds in contrast to maintaining the same level of functionality, thus exciting many postoperative problems (Goligher, 1980). The innovation of sphincter reserving type of surgery was a breakthrough in the pursuit to secure an effective closure of a fistula while preserving the patient's chance to keep continence. On the contrary, these procedures do not fully eliminate the challenges related to recurrence and patient suffering. This explains the reason for the continuous search for innovation (Read, Devoe, & Rubin, 1980; Mentes, Ataman, Hasdemir, & Yildiz, 2008). Over the past years, the continuing spread of minimally invasive surgical strategies, such as video-assisted to freedom from fistula treatment (VAAFT) and transanal advancement flap repair (TAFR), has led to the use of new types of treatments for the patients. The leaky junctions of the abnormal anatomical configuration of fistulae are the main affected section by these approaches, and therefore, they may be the limiting factor for the widespread implementation of these treatments (Shah et al., 2014; Wexner et al., 2007). On the other hand, these techniques provide the potentials for giving lower rates of morbidity and shorter recuperation time. Humanize: A state-of-the art strategy that combines the strengths of the two major approaches, the conventional and minimally invasive practices is introduced in the present work of Porrett and co-authors (2018). Such technique entails clear showing by using corresponding imaging as well as precision in nearby expert surgical treatment. Not only is the research done a perfect mix of methodologies and decision-making processes that are currently being used in this fistula surgery, but also offers the reader a dissected look at the surgical measures used during this particular surgery. A primary goal is to elucidate better the success of fistula treatment through the identification of the benefits of different gynaecologic approaches. These methods comprise numerous of which are representing increased visibility, minimal tissue damage, and optimal healing courses during the surgical operation. The presentation of case study is unique in the sense that it is not limited only to the technical aspects of surgery. It, in fact, takes into account a wide range of postoperative care protocols. These functions
are really for an easy recovery of patients and a lessen of complications. Apart from the basic theory on the pain management, provision of diets and post-operative wound care, the patient must be treated effectively well for achievement of the desired results for treatment (Mentes et al., 2008). The principal goal of this overall case study is to create a reference point for the following efforts in the area of treatment for the challenging transperic fistulas. By which it stipulates the basis for reformation in fistula treatment, which is considered as a corrective procedure with little patient health-related concerns. This is done by showing the patients the integration of the latest surgical technology with a comprehensive treatment. The study is assessed to spark some research projects and innovation in colorectal surgery sector, which will thus bring about treatment methods that are more successful and patient-friendly.

Case Presentation

Patient Information

The current one is the illustration of the male individual who is 56 years old and he got a diagnosis of a transphincteric fistula that is unwillingness to cure. The one on whom focused researches are planned as part of this specific case study is the patient. Contrarily to the numerous health warning signs communicated to the patient more than one year until now, she still opted not to see a medical expert before. This postponement have resulted from a number of factors including patients opting for surgical treatment, worry of their life after the procedure and difficulty getting the diagnosis. In my view, these instances were most likely one of the key influences. Creative Skills The summing up of the aforementioned confluence of these conditions as the potential trigger of his hesitancy states that it is highly imperative to stress out the complexity of those patients who are enduring the same dilemmas in their medical condition.

Clinical Findings

On the inspection, a peculiar picture appeared because the fistula had transphincteric nature, and that was the location at the difficult 12 o’clock region. This one unique anatomical structure necessitated a treatment which would be both very exacting and clever enough to deal with the problem properly and to keep the sphincter functional throughout the course of the treatment procedure. Incorporating exactness into the therapeutic plan was indeed a mandatory thing if it was supposed to be effective at the same time having no impact on the structural and functional integrity of the sphincter. The crucial role of preparation is what made them pay special attention.

Diagnostic Approach

Our trials for identification of the metal starts with administration of methylene blue and metal probing procedure. The elongated needles had become as faithful allies and dispelled all the misgiving about their role of just mapping the complicated paths of fistula In my opinion, the tests would help the specialist determine the personalized treatment plan that probable would be most effective for a particular patient. Sharpness of the analysis was of key importance. One also, he put this in the notice to the farmers and the general public that their plan could be specific to suit them all and this would bear meaningful results.

Therapeutic Breakthrough

https://journal.silkroad-science.com/index.php/JMGCB - 8
The therapeutic method that was used was groundbreaking, since it combined the time-honored Ayurvedic Kshara sutra technique with the accuracy of contemporary surgical procedures. Using this method, the Kshara sutra was applied with great care, and it was accompanied by a precise curettage of the distal tract. In the aftermath of this, a methodical window packing approach was implemented in order to proactively regulate and direct the healing process. A new benchmark for the treatment of fistulas was established by this meticulous strategy, which was meant to optimize the effectiveness of the healing process while simultaneously limiting the risk of complications.

Figure A. captured the initial formidable state of the fist

Figure B. At one-week post-intervention, revealed an assertive initial healing response
Figure C. After a further week, displayed an accelerated reduction of inflammation and robust tissue granulation.

Figure D. A testimony to the method's efficacy, showed a fully resolved fistula after merely two months—what could be deemed a near-miraculous healing time given the initial prognosis.

Conclusion

Through this instance report, a critical innovation in the treatment of a layered sphincter breakthrough that becomes the trouble for the patients and the dilemma for colo-rectal surgeons is presented. Drawing upon the Ayurvedic approaches and merging them with the modern surgical precision, this will enable quicker healing and higher chances of success as the introduction of
this standard in medicine is new to the world. The Kshara sutra technique and cleanliness surgery have in at least a little way realized the patients from fistula. On another hand, it could be a way where the fistula patients do not take long to recover each time and being pain free just like people used to think in the past. This therapy's quick recovery and the absence of side effects compared to invasive surgery by augmenting more complication and disabilities shows that a new method may be effective, easy, and risk-free. The case report highlighted the fact that an accurate diagnosis followed by a well-thought plan that utilizes the use of methylene blue as well as metal probing can guide through the fistula which in turn help in identifying its exact site. Besides, the precise consideration was featured as a patient-based treatment, it enhanced the functions of customization in the area of medical surgery. Attentive and skill organizational performance is very necessary for the efficient use of window packaging additionally, besides the use of Kshara sutra (curative thread) need to apply expertise. Hence, it is due to these new approaches to colorectal surgery that we might expect great policy improvements over the coming years. It has the aim of facilitating inter-weaving of the old wisdoms and the latest science and serves as the view changer regarding the therapeutic trends. Nonetheless, the actual extent of the influence of kshara sutra integration with contemporary surgery can only be discovered through other further research rounds, where it may or may not be generalized to all types of patients. The report of the case presented that is regarding the Transsphincteric fistula treatment procedure could be applied as the base or the specific portion in future researches. This phenomenon inherently testifies that the hybridization of ancient wisdom with modern technology along with the doctor's visits produces not only benefits from the clinical point of view but also the complete satisfaction of patients. Along with the progress in the field of medical research, we should become receptive to multi-disciplinary approaches that may have arisen from different fields and thus can make a significant contribution to the betterment of the health of patients and also change the course of medical treatment
